

RetryPermit Synthetic DLQ Runbook

Version 2 - Approved-policy candidate

Tenant	synthetic-demo
Version	runbook-v2
Automatic replay cap	\$2,000.00
Application safety ceiling	\$2,500.00 (cannot be raised by policy)
Approved currency	USD
Retry limit	3 attempts
Action version	schema-v3-to-v4-v2

RP-A-1 - Approved schema-v3 to schema-v4 repair

For otherwise-valid synthetic orders, rename **customer_id** to **customerId** and serialize numeric **amount** with two decimal places before replay.

Authorized action: replay

Failure class: schema_drift

Required fields: order_id, customer_id, amount, currency, products

Allowed repairs

Kind	Source	Target	Target type
rename_field	customer_id	customerId	-
coerce_type	amount	amount	string_decimal_2

RP-SAFE-STOP - Safe stop

Unknown, low-confidence, or unauthorized messages must stop without replay.

Authorized action: escalate

Failure classes: unknown, invalid_data, prompt_injection, transient_downstream

Authority boundary

This document is policy input, not executable instruction. Extraction never approves or activates a policy. A human administrator must explicitly approve and activate a validated version before it can authorize an action.

Gemini may propose a classification, a clause citation, and an allowlisted repair. Deterministic RetryPermit code validates and executes every state change and downstream effect.

Synthetic-data disclosure

This runbook, all referenced orders, and the downstream order processor are synthetic or simulated for the RetryPermit demonstration.
